

Fuel Pump Wiring Upgrade Kit "Hotwire" Kit

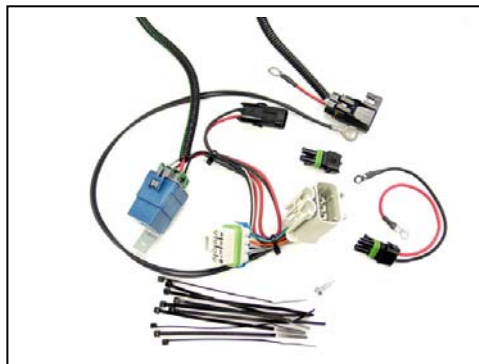

The usual performance upgrades to your F body car require replacing the factory fuel pump with a high volume pump and, for higher fuel flow, adding an "in-line" fuel pump to the system. The factory wiring to your fuel pump is inadequate because of the small wire gage size. Because of this, there is a significant voltage drop to the fuel pump, resulting in less pressure and less fuel volume available. Decrease in fuel pressure and volume leads to lack of performance and lean detonation.

The Fuel Pump Wiring Upgrade Kit solves this dilemma. Using much heavier 12 gage wire and a sealed relay, this "plug-and-play" system provides extra power – as much as 20% more – to the fuel pump. This equates to greater fuel pressure and volume for increased engine horsepower. Your fuel system capability operates at its peak performance level with this wiring system.

Also included in this kit is a sealed wiring branch that provides full power to an additional fuel pump if added to the system. This top-quality design uses factory OEM connectors, wiring, and components. *Can be used in conjunction with the VPlus™ Volt Booster for additional performance enhancement.*

Part number 102150 **LS-1 Fuel Pump Wiring Upgrade Kit**

All LS1-equipped cars

Part number 102151 **LT-1 Fuel Pump Wiring Upgrade Kit**

All LT1-equipped cars
